HEADER TO FINISHED FLOOR IS 96"(RO)

Exterior surface of framing

Vertical Section

Outswing

A 1/2" x 1/2" notch needs to be created in the floor. This allows the flush sill to be flanged to the level of the finished surface. It is important when using this sill to include a gap around the sill itself to allow air to flow through the space. This gap should also be included between the sill and the wall to prevent any issues with air flow.
