A 1" x 1" notch needs to be created in the floor. This allows the flush sill to be flush to the level of the finished surface. The size of the flush sill is 1 3/8" x 1". This drawing shows an 1/4" gap around the sill to allow it to be adjusted accordingly. Drawing does not take into account: pans, membranes, sealant provided by others. The flush sill are not able to withstand air and water intrusion like the weather resistant sill. This option has no weep or drainage incorporated into the track, therefore overhang and protection is important when using the sill. It is important that you include a mop zone adjacent to these doors when choosing this option. Sweep (included) is field applied.
